

Regenerative Power Electronic Solutions

Specially Designed Products for Testing

A combination of knowledge, experience and passion for what we do.

cinergia

CINERGIA is the result of more than ten years of experience in the conception, design, production and service of customized power electronics solutions. Our key areas of expertise include power electronics, DSP-based digital control of converters, communications and software user interface (HMI).

Power Electronics Specialized

The origins of the founding team are in a University R&D center where we developed custom-made power converters for third party companies under a technology transfer framework. We then acquired knowledge and experience in power electronics for different types of applications.

Founded on 2008

CINERGIA's beginnings focused on providing engineering services and customized power electronics solutions. 2014 was an important date for two reasons: we launched the standard product catalogue and the first distributors commercializing it were assigned. The new **ePlus** control platform provides better performance, as well as more modularity through master/slave connections.

Industrial partnership

Our Barcelona based partnership with an important online UPS manufacturer, both at an industrial and R&D level, allows CINERGIA to offer regenerative products that combine the robustness and competitiveness of a UPS with the features and flexibility of an in-house control platform.

Quality policy

Providing high quality solutions is a priority in CINERGIA and our activities of Design and Production of Power Supplies have been certified with the **ISO 9001:2015**, the world's most recognised quality management standard.

Our commitment is to continuously improve the internal processes to increase customer satisfaction and complying with all legal and regulatory requirements for our activity.

> More than 18MW of our units supplied worldwide

Products all over the world

Distributors

UK, Germany, Netherlands, Belgium, Luxembourg, Spain, Portugal, France, Italy, Sweden, Norway, Denmark, Finland, Austria, Switzerland, Poland, Czech Republic, Slovakia, Baltic and Hungary. USA, China, Israel, India and Singapore.

Contact us if you want to distribute our products.

Better than ever, the enhanced Plus family

What's better

MASTER/SLAVE CONNECTION

by using a fiber optics link to increase power/voltage capabilities: GE in AC: can be connected in parallel EL in AC: can be connected in parallel B2C: can be connected in parallel, or series or both

FASTER

30kHz control loop frequency

MORE HARMONICS 50 per phase with 20 free-harmonics

DELTA LOAD for the EL in AC mode

ADJUSTABLE DC TRANSIENT

controllers to improve stability of the system

OPTIMIZED RMS CALCULATION for PV inverters anti-islanding test

SAME ELECTRICAL RATINGS and SAME BANDWIDTH

because the power platform does not change so robustness and ratings remain the same.

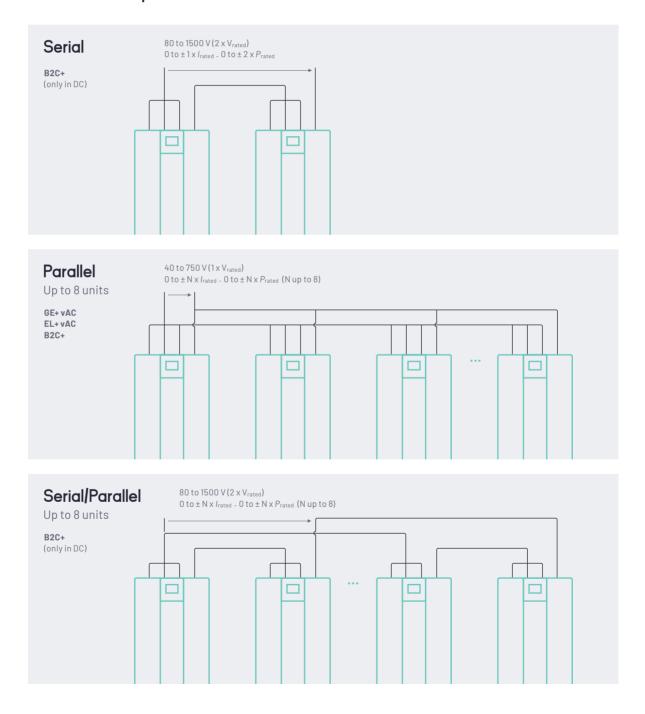

Isolated Transformers

In all DC configurations, it is necessary to use isolation transformers at the input of the device to guarantee the safety of the system.

Three different Master/Slave connection possibilities

Regenerative converters for your test needs

APPLICATIONS

We offer a comprehensive range of AC and DC regenerative power converters for Testing and R&D applications. CINERGIA's products are improved from the experience gained by applying our technology in different fields and working closely with our customers.

C Electromobility

Karat Grids

Mobility is one of the main challenges of the 21st century. Environmental concern is driving a growing demand for more efficient and clean means of transportation. The advances in the field of electromobility are mostly linked to the development of battery technology and power electronics for charging, discharging and driving the electrical motors.

More electric and all-electric aircraft projects along with variable frequency generation systems are driving new developments and new test needs in the fields of avionics. CINERGIA offers a unique Regenerative AC Electronic Load (EL+ vHF) designed to work in a frequency range of 360 to 900Hz used mainly in aircraft generator's testing platforms. Products for this application

EL+ vHF/DC EL+ vHF EL+ vAC EL+ vAC/DC Full B2C+ GE&EL+ vAC/DC GE&EL+ vAC

🖽 Photovoltaic

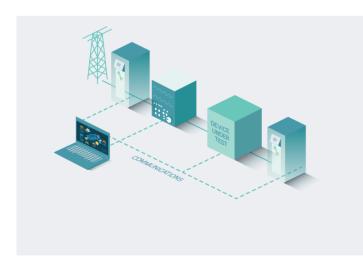

CINERGIA can provide all necessary power devices for PV Inverter testing in a closed energy loop. In such a platform the total power and energy consumption from the grid will be reduced down to the losses of the power converters involved in the test, typically in the range of 20 to 35% of the power generated by the Inverter under test. In R&D, the main advantage will be the reduction of power needed: a 100kW Inverter could be tested in a laboratory with 20 to 35kW installation.

VA Industrial Test

CINERGIA devices have been carefully designed to be part of manual and automated test benches for functional and quality testing as well as research and development of new products. Integrating our devices in test platforms is simple by means of the MODBUS/TCP protocol used (other field buses are offered as an option) and the comprehensive documentation provided of the communication protocol. Labview drivers are supplied with each one of the equipment along with an open source Labview project that will allow a quick start.

Power HiL

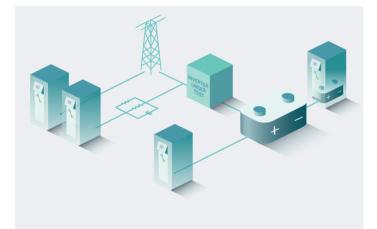

Real Time Simulation and Power Converters are converging into the field

known as Power Hardware in the Loop (PHiL). In these kind of applications, a real world system is simulated on a real-time basis and then emulated: converted in real voltage, current and power. This emulation is performed by a power converter that transforms the reference signal generated by the real time simulator into a voltage or current waveform. A power converter used in such a way is generally known as a power amplifier. Products for this application

Energy Storage System

Electricity has been traditionally produced and consumed at the same time, but the appearance of new battery technologies and the optimisation of existing technologies as fuel cells and flywheel systems is changing this paradigm. Electrical Energy can be now stored cost-effectively and this will have a strong impact in the electrical system (smoothing the intermittency of renewable energies, storing excess of production, shifting peaks of consumption, increasing the efficiency, etc...) and in transportation (cars, trucks, buses, aircraft, ships, ...). Product Overview

PRODUCTS

CINERGIA offers a wide range of products specially designed for testing, perfectly suitable for most applications in the field of Renewable Energy, Smartgrids and ESS, PV Panel Emulation and PV Inverter Testing, Anti-islanding, Power HiL, IEC Testing, Battery and Electric Vehicle Testing. Our product catalogue is unique for the flexibility and versatility of our units. Three main functions are the base of our catalogue: grid simulator (regenerative 40 AC voltage source), AC electronic load (regenerative 40 AC current source) and DC Sink/Source (regenerative 20/40 DC bidirectional sink/source). Each CINERGIA product will include one, two or the three main functions providing a high versatility.

All functions in one cabinet

All Terrain GE&EL+ vAC/DC

Grid Simulator + Electronic Load

The GE&EL product family is the aggregation of Grid Simulators, Electronic Loads and Bidirectional DC Converters in one product.

AC Power 7.5 kW - 160 kW

DC Power 7.5 kW - 160 kW

AC Current (per phase) 11 A - 232 A

DC Current (3 channel / 1 channel) ±10 A / ±30 A - ±185 A / ±555 A

Key Features Bidirectional and Regenerative

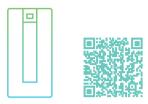

Clean grid current: THDi < 3% and PF > 0.98

Same power in DC and AC

Parallelization of units to increase the power

The most flexible testing equipment in a single cabinet

Two functionalities in one cabinet

All in one GE&EL+ vAC

Grid Simulator + Electronic Load

The GE&EL product family is the aggregation of Grid Simulators, Electronic Loads.

AC Power 7.5 kW - 160 kW

DC Power If you need a product with DC features, please check GE&EL+ vAC/DC.

AC Current (per phase) 11 A - 232 A

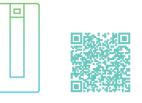

DC Current (3 channel / 1 channel) If you need a product with DC features, please check GE&EL+ vAC/DC.

Key Features Bidirectional and Regenerative

Clean grid current: THDi < 3% and PF > 0.98

Parallelization of units to increase the power

The most flexible testing equipment in a single cabinet

Friendly interface

SOFTWARE

The user interface used by CINERGIA devices has been developed by our R&D team, to offer total control of the device, with a comfortable and intuitive design. This allows us to take full advantage of the capabilities of the device, as well as the programming and execution of standardized or self-created tests.

Remote Control port ~ LAN Ethernet with Modbus/TCP protocol.

- ~ Labview Drivers
- ~ RS485(optional)

Digital IO port

- ~ 4 digital inputs
- ~ 3 relay outputs ~ 1 emergency stop

Optional analogue port

- ~ 6 analogue input 0-10V
- ~ 6 analogue output 0-10V

Windows 7/10 user interface for remote operation and data acquisition.

Features and capabilities

*The software functions available on each product depends of its features.

□ AC Operation⁽¹⁾

In AC, each phase can be independently configured: RMS current, phase delay, harmonics content, free-frequency harmonic and transition ramps. A plot shows the expected waveform, the theoretical FFT representatino, RMS, peak, CF and THD.

□ DC Operation

Access to all DC set points and limits. Thanks to Multichannel feature, each phase can have a different Operation Mode: voltage, current, power, resistance and advanced DC applications. Transition ramps, voltage and current limits can be modified. The limits for sink and source operation are different for safer testing.

Harmonics⁽²⁾

The device can generate simultaneously harmonics up to the 50th. The first 20 allow the injection of sub-harmonics, interharmonics and high frequency harmonics up to the 50th, setting both the magnitude and phase delay.

Sequence

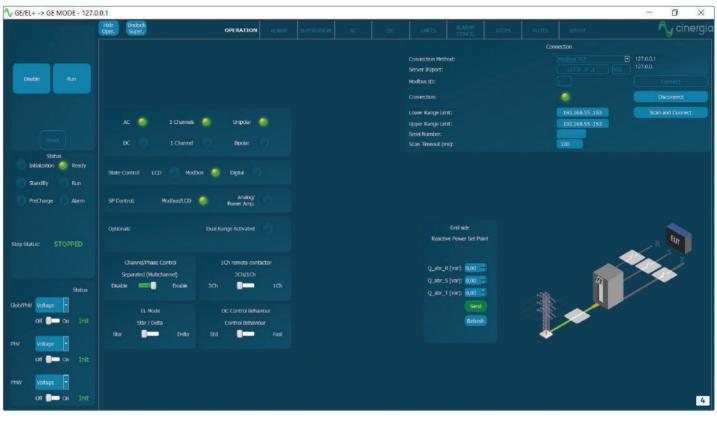

The User Interface Software integrates a Sequence Editor to create automatic test sequences, save them for future use and import them in .CSV files. A smart data logger can be activated from the LCD of the unit to record automatically the resulting voltage and current measurements with a time resolution of 400 ms.

Power and Impedance

The active and reactive power of each phase is independently controlled. In Impedance mode, the device emulates an RLC load allowing to parametrize resistance, inductance and capacitance per phase making this device suitable for Anti-Islanding test of grid converters.

Multichannel (4)

Enabling the Separated Channel Control converts the device in three functionally independent DC Bidirectional Power Supplies, sharing the common negative rail. Each channel can have a different status (ON, OFF, Warning, Alarm), Operation Mode (see Range and Specifications table), Setpoint, Ramp and Limits.

Steps Mode (3)

Step test files are saved and executed by the DSP allowing deterministic timing with a resolution of 66µs. The user gains access to all registers of the device to create complex test sequences which run directly in the converter without the need of an external computer.

Battery Pack Testing⁽⁵⁾

Enables the user to precisely control the charge, discharge and cycling of a Battery. Basic parameters include the charge/discharge current, fast charge and floating voltages while Advanced parameters add Energy (Ah) and Time as transition conditions. Profiles for each Battery technology can be saved and imported in .CSV files.

Disturbance Generation

The steps mode includes predefined easyto-use test panels. The AC faults panel is a powerful yet intuitive editor which allows generating and configuring flicker. Specific profiles can be saved in .csv files, modified, and reused by importing an existing one.

Battery Emulation

The **B2C+** integrates a mathematical model to emulate the voltage behaviour of a real battery pack. The output voltage will change as a function of the SOC and Current. By configuring the provided parameters, the voltage profile can be adjusted to match different technologies: Lilon, NiMH, NiCd, Pb, Flux, etc.

Linear & Non-Linear

The capacity to emulate linear and non-linear loads is one of the main features of the 40 Electronic Load. Through our intuitive control software, the magnitude of harmonics can be set and different types of loads can be generated.

PV Panel Emulation ⁽⁶⁾

Based on the single-diode equivalent circuit of a PV cell and the series-parallel connection of cells to form a panel. A Runtime functionality allows the simulation of a complete day by launching different irradiance and temperature setpoints from a.csv file, enabling the user burn-in and functional tests of PV Inverters.

Parallel Mode

The device can be controlled in parallel mode where all phases are short-circuited internally. This mode it's suitable for single-phase applications. To increase the total power of the solution, the device can be connected in parallel* with multiple devices.

IEC Testing

Software includes a library supporting IEC compatible tests. The profiles defined in the standards are preloaded in the software for a user friendly execution and edition. Currently the following standards are available: IEC61000-4/11, IEC61000-4/13, IEC61000-4/14, IEC61000-4/28.
